Learning Objectives

1. Which features of organizations do managers need to know about to build and use information systems successfully?
2. What is the impact of information systems on organizations?
3. How do Porter’s competitive forces model, the value chain model, synergies, core competencies, and network economics help companies develop competitive strategies using information systems?
4. What are the challenges posed by strategic information systems and how should they be addressed?
• Problem: No online presence, powerful competitors, variable inventory
• Solutions:
  – Develop online sales process
  – Experiment with flash sales
• Demonstrates IT’s central role in defining competitive strategy

Should T.J. Maxx Sell Online?

1. Features of Organizations

• Information technology and organizations influence each other
  – Relationship influenced by organization’s
    • Structure
    • Business processes
    • Politics
    • Culture
    • Environment
    • Management decisions

The two-way relationship is mediated by many factors, not the least of which are the decisions made—or not made—by managers. Other factors mediating the relationship include the organizational culture, consumer, politics, business processes, and environment.

FIGURE 3.1 THE TWO-WAY RELATIONSHIP BETWEEN ORGANIZATIONS AND INFORMATION TECHNOLOGY
• What is an organization?
  – Technical definition:
    • Formal social structure that processes resources from
      environment to produce outputs
    • A formal legal entity with internal rules and
      procedures, as well as a social structure
  – Behavioral definition:
    • A collection of rights, privileges, obligations, and
      responsibilities that is delicately balanced over a period
      of time through conflict and conflict resolution

In the microeconomic definition of organizations, capital and labor (the primary production factors provided by
the environment) are transformed by the firm through the production process into products and services
(products to the environment). The products and services are consumed by the environment, which supplies
additional capital and labor to improve the productivity loop.
1. Features of Organizations

- **Features of organizations**
  - Use of hierarchical structure
  - Accountability, authority in system of impartial decision making
  - Adherence to principle of efficiency
  - Routines and business processes
  - Organizational politics, culture, environments, and structures

2. Routines and business processes

- Routines (standard operating procedures)
  - Precise rules, procedures, and practices developed to cope with virtually all expected situations
- Business processes: Collections of routines
- Business firm: Collection of business processes

3. All organizations are composed of individual routines and behaviors, a collection of which make up a business process. A collection of business processes make up the business firm. New information system applications require that individual routines and business processes change to achieve high levels of organizational performance.

**FIGURE 3.4 Routines, Business Processes, and Firms**
• Organizational politics:
  • Divergent viewpoints lead to political struggle, competition, and conflict.
  • Political resistance greatly hampers organizational change.

• Organizational culture:
  • Encompasses set of assumptions that define goal and product
    • What products the organization should produce
    • How and where it should be produced
    • For whom the products should be produced
  • May be powerful unifying force as well as restraint on change

• Organizational environments:
  • Organizations and environments have a reciprocal relationship.
  • Organizations are open to, and dependent on, the social and physical environment.
  • Organizations can influence their environments.
  • Environments generally change faster than organizations.
  • Information systems can be instrument of environmental scanning, act as a lens.
Disruptive technologies
- Technology that brings about sweeping change to businesses, industries, markets
- Examples: personal computers, word processing software, the Internet, the PageRank algorithm
- First movers and fast followers
  - First movers—inventors of disruptive technologies
  - Fast followers—firms with the size and resources to capitalize on that technology

Five basic kinds of organizational structure
- Entrepreneurial:
  - Small start-up business
- Machine bureaucracy:
  - Midsize manufacturing firm
- Divisionalized bureaucracy:
  - Fortune 500 firms
- Professional bureaucracy:
  - Law firms, school systems, hospitals
- Adhocracy:
  - Consulting firms
• Other organizational features
  – Goals
  • Coercive, utilitarian, normative, and so on
  – Constituencies
  – Leadership styles
  – Tasks
  – Surrounding environments

2. Learning Objectives

1. Which features of organizations do managers need to know about to build and use information systems successfully?
2. What is the impact of information systems on organizations?
3. How do Porter's competitive forces model, the value chain model, synergies, core competencies, and network economics help companies develop competitive strategies using information systems?
4. What are the challenges posed by strategic information systems and how should they be addressed?

2. The Impact of Information Systems on Organizations

• Economic impacts
  – IT changes relative costs of capital and the costs of information.
  – Information systems technology is a factor of production, like capital and labor.
  – IT affects the cost and quality of information and changes economics of information.
    • Information technology helps firms contract in size because it can reduce transaction costs (the cost of participating in markets)
      – Outsourcing
• Transaction cost theory
  – Firms seek to economize on transaction costs (the costs of participating in markets).
  – Vertical integration, hiring more employees, buying suppliers and distributors
  – IT lowers market transaction costs for firm, making it worthwhile for firms to transact with other firms rather than grow the number of employees.

• Agency theory:
  – Firm is nexus of contracts among self-interested parties requiring supervision.
  – Firms experience agency costs (the cost of managing and supervising) which rise as firm grows.
  – IT can reduce agency costs, making it possible for firms to grow without adding to the costs of supervising, and without adding employees.

• Organizational and behavioral impacts
  – IT flattens organizations
    • Decision making is pushed to lower levels.
    • Fewer managers are needed (IT enables faster decision making and increases span of control).
  – Postindustrial organizations
    • Organizations flatten because in postindustrial societies, authority increasingly relies on knowledge and competence rather than formal positions.
Information systems can reduce the number of levels in an organization by providing managers with information to supervise larger numbers of workers and by giving lower-level employees more decision-making authority.

Organizational resistance to change

- Information systems become bound up in organizational politics because they influence access to a key resource—information.
- Information systems potentially change an organization’s structure, culture, politics, and work.
- Most common reason for failure of large projects is due to organizational and political resistance to change.
The Internet and organizations
- The Internet increases the accessibility, storage, and distribution of information and knowledge for organizations.
- The Internet can greatly lower transaction and agency costs.
  - Example: Large firm delivers internal manuals to employees via a corporate Web site, saving millions of dollars in distribution costs

Organizational factors in planning a new system:
- Environment
- Structure
  - Hierarchy, specialization, routines, business processes
- Culture and politics
- Type of organization and style of leadership
- Main interest groups affected by system; attitudes of end users
- Tasks, decisions, and business processes the system will assist

1. Which features of organizations do managers need to know about to build and use information systems successfully?
2. What is the impact of information systems on organizations?
3. How do Porter's competitive forces model, the value chain model, synergies, core competencies, and network economics help companies develop competitive strategies using information systems?
4. What are the challenges posed by strategic information systems and how should they be addressed?
• Why do some firms become leaders in their industry?
  
• Michael Porter’s competitive forces model
  – Provides general view of firm, its competitors, and environment
  – Five competitive forces shape fate of firm:
    1. Traditional competitors
    2. New market entrants
    3. Substitute products and services
    4. Customers
    5. Suppliers

In Porter’s competitive forces model, the strategic position of the firm and its strategies are determined not only by competition with its traditional direct competitors but also by their other forces in the industry’s environment: new market entrants, substitute products, customers, and suppliers.
3. Using Information Systems to Develop Competitive Strategies

- Substitute products and services
  - Substitutes customers might use if your prices become too high, for example, iTunes substitutes for CDs
- Customers
  - Can customers easily switch to competitor’s products? Can they force businesses to compete on price alone in transparent marketplace?
- Suppliers
  - Market power of suppliers when firm cannot raise prices as fast as suppliers

- Four generic strategies for dealing with competitive forces, enabled by using IT:
  - Low-cost leadership
  - Product differentiation
  - Focus on market niche
  - Strengthen customer and supplier intimacy

- Low-cost leadership
  - Produce products and services at a lower price than competitors
  - Example: Walmart’s efficient customer response system
- Product differentiation
  - Enable new products or services, greatly change customer convenience and experience
  - Example: Google, Nike, Apple
  - Mass customization
AUTOMAKERS BECOME SOFTWARE COMPANIES p130

1. How is software adding value to automakers’ products?
2. How are the automakers benefiting from software enhanced cars? How are customers benefiting?
3. What value chain activities are involved in enhancing cars with software?
4. How much of a competitive advantage is software providing for automakers? Explain your answer.

Focus on market niche
- Use information systems to enable a focused strategy on a single market niche; specialize
  - Example: Hilton Hotels’ OnQ system

Strengthen customer and supplier intimacy
- Use information systems to develop strong ties and loyalty with customers and suppliers
  - Increase switching costs
  - Example: Netflix, Amazon

Identifying Market Niches in the Age of Big Data p133

1. Describe the kinds of data being analyzed by the companies in this case.
2. How is this fine-grained data analysis improving operations and decision making in the companies described in this case? What business strategies are being supported?
3. Are there any disadvantages to mining customer data? Explain your answer.
4. How do you feel about airlines mining your inflight data? Is this any different from companies mining your credit card purchases or Web surfing?
The Internet's impact on competitive advantage

- Transformation or threat to some industries
  - Examples: travel agency, printed encyclopedia, media
  - Competitive forces still at work, but rivalry more intense
  - Universal standards allow new rivals, entrants to market
  - New opportunities for building brands and loyal customer bases

Value chain model

- Firm as series of activities that add value to products or services
- Highlights activities where competitive strategies can best be applied
  - Primary activities vs. support activities
- At each stage, determine how information systems can improve operational efficiency and improve customer and supplier intimacy
- Utilize benchmarking, industry best practices

This figure provides examples of systems for both primary and support activities of a firm and its value partners that can add a margin of value to a firm's production or service.
• **Value web:**
  – Collection of independent firms using highly synchronized IT to coordinate value chains to produce product or service collectively
  – More customer driven, less linear operation than traditional value chain

![The Value Web Diagram](image)

• Information systems can improve overall performance of business units by promoting synergies and core competencies
  – **Synergies**
    • When output of some units used as inputs to others, or organizations pool markets and expertise
    • Example: merger of Bank of NY and JPMorgan Chase
    • Purchase of YouTube by Google
• Core competencies
  – Activity for which firm is world-class leader
  – Relies on knowledge, experience, and sharing this across business units
  – Example: Procter & Gamble’s intranet and directory of subject matter experts

• Network-based strategies
  – Take advantage of firm’s abilities to network with one another
  – Include use of:
    • Network economics
    • Virtual company model
    • Business ecosystems

• Traditional economics: Law of diminishing returns
  – The more any given resource is applied to production, the lower the marginal gain in output, until a point is reached where the additional inputs produce no additional outputs

• Network economics:
  – Marginal cost of adding new participant almost zero, with much greater marginal gain
  – Value of community grows with size
  – Value of software grows as installed customer base grows
Virtual company strategy
- Virtual company uses networks to ally with other companies to create and distribute products without being limited by traditional organizational boundaries or physical locations
- Example: Li & Fung manages production, shipment of garments for major fashion companies, outsourcing all work to more than 7,500 suppliers

Business ecosystems
- Industry sets of firms providing related services and products
  - Microsoft platform used by thousands of firms
  - Walmart’s order entry and inventory management
- Keystone firms: Dominate ecosystem and create platform used by other firms
- Niche firms: Rely on platform developed by keystone firm
- Individual firms can consider how IT will help them become profitable niche players in larger ecosystems

The digital firm era requires a more dynamic view of the boundaries among industries, firms, customers, and suppliers, with connected but autonomous businesses sharing a common ecosystem. In the ecosystem model, multiple industries work together to deliver value to the customer. IT plays an important role in enabling a dense network of interactions among the participating firms.
Sustaining competitive advantage
- Competitors can retaliate and copy strategic systems
- Systems may become tools for survival

Aligning IT with business objectives
- Performing strategic systems analysis
  - Structure of industry
  - Firm value chains

Managing strategic transitions
- Adopting strategic systems requires changes in business goals, relationships with customers and suppliers, and business processes
